

# WATERSHED PLANNING

Comprehensive planning to ensure successful implementation

## Project Experience

HEI has worked with a variety of local government units across Minnesota to help develop comprehensive plans specifically tailored to uniquely diverse needs.

## Creating a plan that won't just sit on a shelf

Your plan is the single most important guiding document for your organization. All operations, projects, and services are directed by the plan in some way, shape, or form. Your funding and needs are continually changing, so your plan must be treated as a living document to be updated and amended as new information and resources become available. At Houston Engineering, Inc., we can help you develop an agile, durable, and living water management plan.

The basis of watershed planning is to create a clear vision for your watershed. Your vision should consider the unique characteristics of your watershed's physical, political, and social make-up and identify sustainable solutions to solve practical problems. Careful consideration of information from previous watershed projects and stakeholder interests are critical to our approach. The history of your watershed is important to us, because it provides insight into the long-term results of prior management strategies and land use practices.

We respect the experience, opinions, and wishes of your staff and constituents, and we listen carefully to the views of those who have a vested interest in the mission and future direction of your watershed. This investment leads to comprehensive plans that improve your day-to-day operations and help gain consensus. **We can support your efforts to develop a plan that is used daily!**
